Project Report: Shark Tank India Investment Analysis

1. Introduction

Shark Tank India has emerged as a significant platform for the Indian startup ecosystem, providing entrepreneurs with capital and mentorship. However, the raw data from these pitches is often unstructured, making it difficult to identify broader investment trends. This project aims to bridge that gap by conducting an end-to-end data analysis of the show's investment patterns. By transforming raw pitch data into actionable insights, the project explores how capital is distributed across different industries and how individual "Sharks" make their investment decisions.

2. Abstract

The **Shark Tank Investment Analysis** project is a comprehensive data analytics study that utilizes Excel, Python, and Power BI to evaluate the startup landscape as seen on the show. The analysis focuses on a dataset of 175 deals, uncovering critical metrics such as industry dominance, seasonality in deal volume, and average equity stakes. Key findings reveal that the **Food industry** leads with over 22% of total investment, and Season 2 experienced a significant spike in activity compared to Season 1. The project culminates in an interactive Power BI dashboard that allows users to filter data by individual Shark, season, and industry to visualize the distribution of capital.

3. Tools Used

To ensure data accuracy and high-quality visualization, the following "Tech Stack" was utilized:

- **Microsoft Excel:** Used for initial data cleaning, standardization of startup names, and preliminary financial calculations.
- **Python (Pandas, Matplotlib, Seaborn):** Employed for Exploratory Data Analysis (EDA), handling duplicate records, and performing complex data transformations.
- **Power BI:** Used for final data modelling (DAX) and creating an interactive dashboard with dynamic filtering capabilities.

4. Steps Involved in Building the Project

The development of this project followed a structured data pipeline:

1. **Data Cleaning & Standardization (Excel/Python):** Standardized startup names and handled missing values to ensure a complete dataset.
    - Synchronized revenue figures by applying a 12x multiplier to monthly data to maintain annual consistency.

    - Normalized currency units (Lakhs and Crores) into a single numeric scale for accurate global calculations.

2. **Exploratory Data Analysis (Python):** Conducted a "Pitch-to-Investment" ratio analysis across seasons.
    - Validated the integrity of the 175 total deals against individual Shark investment records.
    - Identified and removed duplicate entries that could skew the total investment sums.
3. **Data Transformation (Unpivoting):** Transformed Shark-specific investment and equity columns into a "Long" format. This step was crucial for building a dashboard that allows users to filter by a specific Shark.
4. **Dashboard Development (Power BI):** Developed DAX measures to calculate KPIs like total investment, average equity, and deal success rates.
    - Designed interactive visualizations, including industry-wise distribution charts and individual Shark profiles.

5. Conclusion

The analysis successfully highlights the maturing nature of the Indian startup market, as evidenced by the spike in deal volume in Season 2. While the Food industry remains the primary interest for investors, the emergence of Beauty/Fashion and Manufacturing as strong secondary sectors indicates a diversifying ecosystem. Furthermore, the lean average equity stake of 5.08% suggests that despite the intense negotiations, founders are successfully retaining significant ownership. This project demonstrates how data cleaning and unpivoting techniques can turn unstructured media data into a powerful tool for understanding venture capital trends
